

# Ultrashort laser pulses with metal surfaces

El problema: un pulso láser (campo eléctrico dependiente del tiempo  $F(t)$ ), incide en forma rasante sobre una superficie metálica. Un electrón de la banda de valencia se ioniza: Efecto fotoeléctrico.

$$\hat{H}(\vec{r}, t) = -\frac{\nabla^2}{2} + V_s(\vec{r}) + \vec{r} \cdot \vec{F}(t)$$

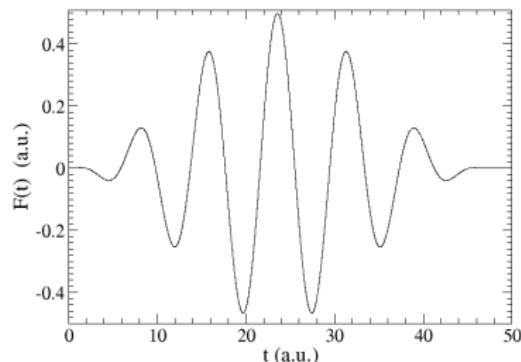

# Ultrashort laser pulses with metal surfaces

The combined surface and laser potential is

$$V(z, t) = V_S(z) + zF(t)$$

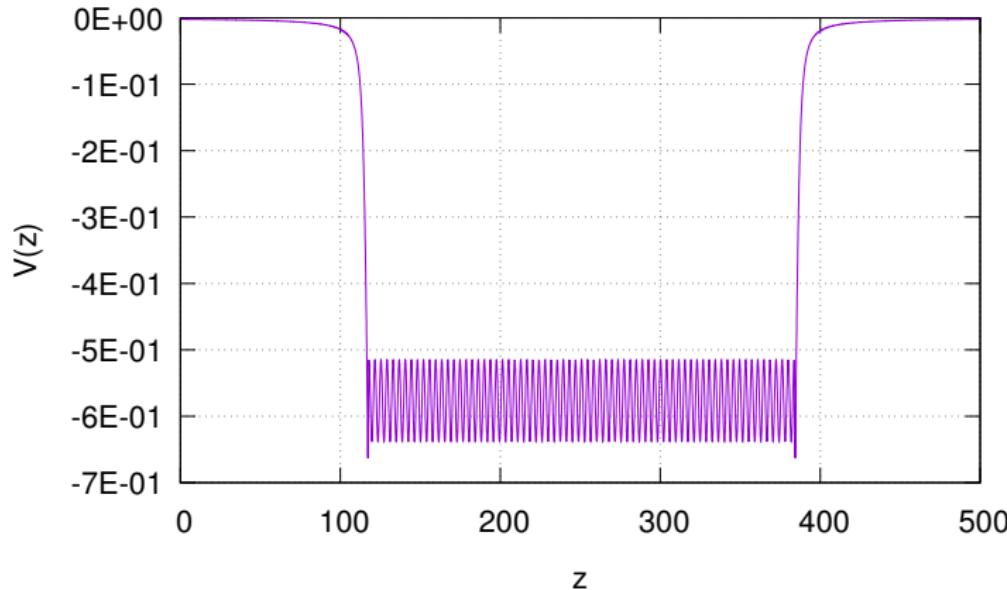

where

$$F(t) = F_0 \sin(\omega t + \varphi) \sin^2\left(\frac{\pi t}{\tau}\right)$$
